

Scientific Commentary on Keith's Recorded Mental Communications

Larry E. Johnson, 151 DuPont Ave. N.E., Hector, MN 55342

May 9, 2010

1 page 1: Chapter I: Introducing mental communications between intellects

We've all detected these forced thoughts now and then flowing through our mind, but perhaps we didn't know that we can become better at this type of communication. The most important point here is that we need to realize the genuine need that this present world has for us to wake up and begin to explain to people what is really happening in our creation, and what is wrong morally on this planet at present that needs correcting.

2 page 4: Chapter II: Our mind is not a part of our body; the great mental world

There is a central universe, separate from ours, as our universe is one of seven superuniverses as explained in the *Urantia Book* that orbits around Paradise that's in the center. The center is where all Creators come into existence, and their level of intellect is much higher than the human level that dominates these outer creations, where apparently both physical and mental world counterparts exist in both central and outer universes. For example, we have nominally about 100 chemical elements, even up to 200 for special situations like for the bio-silicon bodies, but the central universe has 1000 chemical elements according to the *Urantia Book*.

As over-concerns with expensive and time-consuming health-care issues seem to be a characteristic of our present times, one really needs to see the other point of view as found in Keith's book: Our bodies have the entire humanitys of the first and second creations in charge over all our involuntary muscles, as mind-elements! They're intelligent and caring; and this is also why I feel that there really is no such thing as an "accident". Our physical life here has only one purpose, to start us out on the nearly-eternal mental world existence.

3 page 9: Chapter III: The mind and intellect made plain

For me, a physicist, I need as many relationships as possible between my physical experiences and the mental universe, to understand the mental universe better, using what I understand in mathematical physics especially, and so I would like to mention several of these in this Commentary. Foremost is the concept of 'space', which becomes the very fruitful "spacetime" of relativity in the case of our physical universe. But what is it for the mental universe? Well, for several years now I have been led to study what is called "*the mind grid*" or simply "*the grid*" (this is why my email is: gridphysics@hotmail.com), which is a new type of abstract 'space' that has very useful and interesting mathematical properties,

and the mental messages received tend to imply that grids are definitely somehow the ‘spacetime’ for the mental universe and its abstract thought:

“The mental world, however - the world of forms that may translate faster than the speed of light, not in wave motion, but through an instantaneous transfer through the etheric existence-planes along the grid lines, the mental control of these through geometrical form, through artistic expression, through the higher abstractions of science, philosophy, and other forms of expression, is not as well-known in your planet and plane of existence. This is the great problem for your planet and existence-plane: to transcend the logic of your physical experience to the purely mental level of the intuitive and the abstract.” (interpreted from transcript 15 of 10/17/1989, received by Robert Crane and Lynn Charlson near Excelsior, MN.)

The grid is independent of time, but not frequencies, and when 2-space-dimensional, these two grid coordinates are orthogonal grid-distances, or grid-velocities (where with respect to *frequency* replaces with respect to time), with one axis always for less than grid-light-speed c' , and the other axis for greater than c' . On the grid, $c' = 144$ in natural grid units, but the most important grid-velocities are those of the forcefields, that can be greater than c' . Here, frequency = information on the grid, and ‘light’ on the grid is a c' -flow of the grid’s thought-forms. Spacetime’s most important symmetry is 3D spherical symmetry, because the physical universe is all about particles and their interactions. For the mental universe, the grids are usually multi-dimensional, and the most important geometrical symmetries are, like multi-D conformal symmetry, those of geometrical forms that are thought forms. There are three basic types of grids, viz. those for $v < c'$, those for $v > c'$, and fractal grids where there is no limit to the sublattices. Each form-axis of our familiar 3-space is really the basic 2D from the inverse space grid, making $2^3 = 8$ altogether, which with the fundamental 2D of the primary field adds up to the fermionic 10D. A similar picture first includes the 3-space dimensions for matter-direct, matter-inverse, antimatter-direct, and antimatter-inverse, giving 12D for physical realm ($v < c$) and another 12D for etheric realm ($v = c$), i.e. getting a total of $12 + 12 + 2 = 26D$, including the 2D of the primary field, for our bosonic 26D. This is how the more advanced human intellects regard the fermionic 10D and bosonic 26D, rather than our present-day indirect theoretical reasonings! (t.295 of 4/17/2000)

The physics of ordinary flat spacetime is the familiar Lorentz and Einstein relativity where the speed c of spacetime light is a limit-velocity, so that nothing can travel faster than c ; but the mathematical physics of the flat 2D grid has to be something other than a relativity, because the speed $c' = 144$ gud/gui here is like Robert T. Jones’ singular-velocity¹ on a 1,1 conformal-Lorentz spacetime, where there are velocities on either side of c' . The multi-dimensional grids are then formed as Cartesian products of these.

4 page 12: Chapter IV: Mental Communication is a simple matter

We easily detect some mental communications once in awhile because these usually are the ones sent to us deliberately from powerful sources at very high levels. At the super-plane levels, above the planetary levels, Keith describes how a marked improvement in mental communication clarity resulted by having these thoughts sent to him from a male, female pair in the super-plane. The strongest form of energy in all creation, as taught to me by the positive Sirians² during their 14th mission to Earth of 1987 - 2011, is the sexual attraction of the male, female pair, called “Kula” energy, which I think probably is why Keith’s idea and experiment worked so well (but I have no doubt this technique was already well-known and practiced from the upper super-planes!). Why this technique does not work so well when confined to the planets, might be because of the lesser form of the Kula energy involved.

¹J. of the Franklin Inst., Vol. 275 (Jan, 1963) 1.

²Pronounced ‘Seer-eye-huns’; from the greater universe, called “Kositron”.

5 page 15: Chapter V: The 7th plane is the first spiritual plane

But the highest of the 7 Mansion Worlds of Jerusem (ref: *Urantia Book*), one step below the super-planes, is our Heaven of the Bible, etc., and many from our planet's humanity evolve to still higher planes in the great mental universe.

6 page 18: Chapter VI: The mental universe versus the physical universe

There are several items in Keith's book that are also found in the *Urantia Book*, possibly under slightly different naming, and Keith's book also helps to clarify some things in the *Urantia Book*. The main items are: here "the great central sun" is of course "the Central Universe" or it might refer to its nucleus, "the Eternal Isle of Paradise", in the *Urantia Book*. This is where Creator intellect originates (20C), just as human intellect is the highest type of intellect that originates in the *Urantia Book*'s seven superuniverses, or from the "planets" of Keith's book. Similarly, it's clear to me that Jerusem's seven Mansion Worlds in the *Urantia Book* are the same as Keith's seven planes. Incidentally, we have been able to surmise that our human intellect has many levels of what we call *consciousness* or *awareness*, because for example during the first creation all human intellects manifested in the electromagnetic currents within live planets (i.e., where there was sufficient 'magnetism'), but the humans during the second creation who were lodged within certain vegetation on the planet's surface possessed slightly higher consciousness than the type within the planet, and then during our present third creation we owe to our animal bodies a potential for somewhat still higher consciousness than all these other types before us.

Further along these lines of getting to higher consciousness with just the age-old human-level of intellect, certain mental messages received by Robert Crane and Lynn Charlson (transcript 7) indicates that the level of consciousness in a given type of intelligent being is proportional to the basic signal speed that their bodies use, where our carbon and water based body signal speeds are *c*-limited, since at most visible light is used. But there are higher types of bodies, such as the silicon and germanium based kind that use signal speeds well-above *c* (I think these would be gravitational/nuclear, on the grid of inverse space). This is probably the type of body used by the *Urantia Book*'s "primary Midwayer", who can move at up to twice the speed of light. A transcript quote for this is as follows:

"The sun has a higher signal velocity than does the planetary system. We are aware at the 3×10^5 km/sec level because this is the usual c =light-velocity range that our bodies handle and are sensitive to. There are many signal velocities above this that we are not sensitive to, although they are impacting on part of our internal structure. The simplest type of crystal is one like the channel is holding (a Vogel-cut quartz crystal). It has very low signal velocity, 0.3 km/sec or the velocity of sound, but it also has velocities up to 3×10^5 km/sec. Signal velocities for the sun extend up to 3×10^8 km/sec. Here we are relating signal velocity to states of awareness or consciousness. The awareness of most people is on material things here, but when the velocity increases towards the speed of light, we make the transition to the dimension of thought wherein form becomes awareness or an actuality rather than a mere abstraction, i.e., the level of the solar system where the consciousness now extends to the entire solar system and the other planets therein. This is from the speed of light, upward. We are able to sense these higher speeds, within the cholesterol molecule of the brain, using the organic system, because this is the most complex molecular crystalline form known, currently the liquid crystalline form in the organic system. These vibrations can be solidified into a different type of being other than the carbon being that you are now. This is a question of future evolution. You may evolve a body of silicon to replace carbon, and its existence through time would be in terms of millennia instead of years." (adapted

from transcript 7 of 11/3/1988)

7 page 22: Chapter VII: Our very long life in the mental universe

It appears logical to me that these more solid-state types of bodies would probably represent examples of mankind making the transition more slowly from the carbon and water type of human body to the states without any body in the great mental world. In the transcript 15 of 10/17/1989 for example, we find: “You may ascend to another level of structure, a higher crystallized level, so you are not limited to limited-time duration, carbon-based, nitrogen/oxygen, organic bodies. You may transcend to the silicon/selenium/germanium level of solid and ionic form and body, and, in this body, live for many thousands, perhaps many millions of years in earth time, however, more in touch with the astral world, and as a permanent part of the astral world. At present you may only touch the astral world through the element water, which is abundant and which interacts with every organic molecule in the body by coming in contact and forming chain structures and spirals around these organic molecules, then pulsing through every cell, or relating to the blood and so on. But these are only transitory.”

The “pole-star” is first mentioned here (25C), but we don’t comment on the pole-star until the comments on Chapter X below (34C).

8 page 26: Chapter VIII: Everyone now lives during the third creation

9 page 30: Chapter IX: The early history of man

This chapter goes back only to the beginning of the second creation when it was decided that man’s mind cell should be lodged in certain vegetation on the surface of the earth. Bringing this forward somewhat from the earlier beginning of the first creation, when man was always a collection of electromagnetic currents within the current-generating galvanic-like layers and soil of earth’s interior, can be found in Chapter VI, page 19, etc. How much more reasonable these accounts of the origin of humanity now appear to us than those invented during the last few centuries by man himself.

10 page 33: Chapter X: The physical nature of the planets

There are many hints in this chapter concerning truths that go far beyond our present-day science. For example, (34A) how could the size of a planetary orbit depend especially on the amount of ‘magnetism’ that the planet generates? This ‘magnetism’ is the higher type of magnetism, the type that determines whether plants will appear spontaneously (23D) or even be able to survive at all (24D) on the planet’s surface! To illustrate what we think this revelation is implying, and also to see that it’s indeed far beyond our present ability to explain completely, consider this: What we consider the innermost planet, i.e. Mercury, has an ordinary magnetic field that has been measured at about 1% of Earth’s in strength, and Venus seems to have no measurable **B**-field at all, but we suppose that this statement on page 34A is based on Mercury and Venus having the stronger higher type of ‘magnetism’ and e.g. Pluto and the recently discovered outer planets have the weaker higher type of ‘magnetism’, so that the inner planets should if we’re correctly interpreting his Chapters X and XI, have the most prolific and healthiest plant life! (i.e. in the appropriate existence-plane where plant life is possible temperature-wise, etc.).

But one surprising revelation that we presently can handle somewhat is the one (35B) that all planetary orbits are circles. We know that in four spacelike dimensions, planetary orbits can only be

perfectly circular, but we had thought that such planetary orbits must be unstable.³ However, when you have conformal symmetry, as one must in inverse space, there is then an extra spacelike dimension from the 5D form space that is so important to the theory of preparticles. From mental messages received by Robert Crane and Lynn Charlson during 1988-2000, I quote: “The principal mass of the proton is created by the positron spinning as it is trapped in various geometrical and vortexal patterns. These are analogous to the patterns or forms that appear in the book *Occult Chemistry*, including the Platonic solids. As the positron spins, it does so in a definite pattern and the nodes or crossing points of these spin patterns, as a sequence of orbital spins, create points in space that become the corners of geometrical objects. So, you have a case of a spinning positron moving through this complex web, as the mind programming brings this into the mass of the proton. The mass of the proton is then colored by this. These are colors of a pure or higher sense, as seen in the astral dimensions beyond our 3D. However, these colors are carried into this dimension on the frequencies of the visible electromagnetic spectrum. So, light relates to color, which relates to the grid pattern that the mind uses to control the positron, and the spin motion of the positron creates the actual mass of the proton. The neutron mass is a counterspin mass and it is rotating oppositely down into our 3D. The proton, in its pure sense of color, never touches this dimension. You may only affect it through the color patterns or light patterns of the electron. The neutron touches our dimension partially. The proton is entirely in another dimension, the dimension of mind, but the proton has a high and low aspect too. The lower aspect of the proton is the positron+electron interaction. I.e., the positron produces the proton and then it may interact with the electron through the tunneling or tube effect, and that is the action which occurs that you see in 3D or spacetime. This is not a direct proton action. It is a positron action. However the positron then goes back to the proton and exchanges this information. [So, this is a very important new viewpoint that we should use to redo the hydrogen atom, so that people will understand this better.] The positron exists both in the high end of the proton and the low end; it also creates the mass of the proton by virtue of the spin, so that mass is similar to any spinning object and, as you know, a spinning object has more energy. This is the manner of the creation of the mass of the proton. The spin of the mass of the proton relates also to gravity; it is not only the mass of the neutron. One (the proton) is positive and one (the neutron) is negative. Gravity is entirely a four-spacelike-dimensional phenomenon, as it is so difficult to replicate or control in 3D. It cannot be shielded in 3D as can electromagnetic fields. It is a function of the proton and mind, and of the positron interaction. That is, if the positron reaches far enough out from the proton, it is analogous to a long enough radius of spin if you were spinning an object about you. It then begins to create frequencies which are not normal to the normal electron spin structure. However, the electron is forced to react with this new spin frequency anyway, and in so doing it creates a temporary distortion in the positron which transmits back to the proton which thus produces a very miniscule change in the lattice or grid structure of the mind that controls the proton. This very small change produces a nuclear or gravitational-type force field - that is, a force field that implodes. There is also a counterforce that explodes, i.e. there is an inward and an outward, two separate forces, the neutron outward and proton inward. For an extremely short period of time, it is possible to actually create an anti-gravitational pulse or force.” (adapted from transcript 6 of 9/24/1988.) So of course the planetary orbit is still stable within our direct 3-space, but their emphasizing here in Chapter X of the 4-spacelike-D circular orbit viewpoint is just a proper way of acknowledging the fact that the gravitational field itself, via the necessary inverse space foundation and in fact as a ‘push-type’ gravity theory, is purely a 4-spacelike-D field, wholly unlike electromagnetism. Transcript 9 of 2/8/1989 also says that, “the planetary orbit is like the atom’s electronic orbits as a series of rotating ellipses which reform into a circle for the total flow of the system.”

A couple of questions that we can formulate from this new information, are: Is this proton-controlling

³See e.g. Amer. J. of Physics, Vol. 37 (Dec. 1969), 1222. (Thanks to Elsa Glover for this ref.)

mind-element made from intellects of the first creation? (like the involuntary care of our bodies, etc.) And, so we might ask whether the positron's messenger rôle mentioned above here is also a part of this mind-element's information flow?

I believe that general relativity is incorrect in making gravity a c -limited forcefield. Instead, the conformal symmetry in the mind-grid allows the significance of the many subspaces of 5D form space, where our time t is not relevant for just the 5 basic form axes, i.e. one encounters no t -dependence when the mathematics is being used to create only form without energy, so that \mathbf{a}^0 drops out. "Of 5D form-space's five form axes $\{\mathbf{a}^1, \mathbf{a}^2, \mathbf{a}^3, \mathbf{a}^4, \mathbf{a}^5\}$, two axes are below the etheric (the electric and magnetic form axes), and two above (the astral and mental). However, in the middle we have the etheric; this is the growth axis of the crystal, and is also the axis of propagation of all organic molecules - DNA, proteins and such. Our dimension uses only the first three form axes. The mental axis corresponds to gamma energy, because it can only appear for gamma energy, which is the positron+electron pair. The astral is extremely dynamic, where color and form quickly precipitate and reform into other shapes and other energy emanations, particularly into those of brilliant white UV. There is no matter needed to define any of these axes; however, they have the power to influence matter." (with help from t.9 of 2/8/89 and t.16 of 10/19/89)

The *Urantia Book* says that there exist ten modified versions of our physical electron, which all have fewer than the 100 ultimatons or koilon quanta that make up our electron.⁴ The *Occult Chemistry book* reveals that there are five types of anu that are a finer type than the anu that make up the quarks of our physical world, and each finer anu has $1/49$ the amount of string-like subtle matter that a given type of anu has. But the clairvoyant investigator C. W. Leadbeater was unable to determine what our physical world's electron was, or what structure it had. But we think that the 100 koilon quanta of 'a planetary' electron cling together into the form of a 1-dimensional flat spiral which can be stretched and bent, and obeys the equation

$$\# \text{ of koilon quanta in electron} = 2(n^2 + 1), \text{ where } n = 7 \text{ for all the planets.}$$

I.e., n is a lattice division factor, so must be at least $n = 2$. Thus, there are just five planes beyond the planets of $n = 7$. Thus it seems obvious that the first two of the ten modified electrons, which have $2(6^2 + 1) = 74$ koilon quanta in their spiral grid forms, are the first modified electron and positron pair, and so forth for each of the five pair of electrons and positrons for what may be the five super-planes. Humans in the planetary existence-planes would not normally detect any objects that are in any of these five super-planes. This is because the planetary electron and positron pair, and the modified electron and positron pairs that form the photons in each of these super-planes, do not interact sufficiently with the finer matter of any higher level above them. Even detection between planetary levels is very difficult. Similarly, with magnetic charge replacing electric charge, it seems correct to conjecture that there exist at least 6 more, or existence sub-planes, below these six electric-pole existence-planes.

In the 5D form space, the number of 3D realities or subspaces = the number, 10, of 2D rotation or spin planes, and Table 1 gives names to these ten 3D subspaces as we presently believe that they form the first seven existence-planes just below the five super-planes. However, a theoretical problem this brings seems to say that nucleons and atomic structure as we know them exist only for the first 3 existence-planes. I.e., one gets the $3 \times (3 \text{ anu that breathe in} + 3 \text{ that breathe out}) = 18$ anu per proton for only the first three existence-planes, or $\{\mathbf{a}^1, \mathbf{a}^2, \mathbf{a}^j\}$ where $j = 3, 4, 5$. So, a problem is: What do the nucleons become for the etheric, astral, and mental planes?

In trying to understand what the pole-star (25C, 34C, 35A) is, and why the pole-star interacts only electrically with earth (34C), I think maybe:

⁴I think that "koilon" (first introduced in *Occult Chemistry*) \equiv ultimatons, but koilon explicitly as primary field quanta first appeared in recent studies of Robert W. Crane.

Table 1: Seven existence-planes (“the planets”) just below the super-planes in the hereafter that Keith discusses, where $k = 1$ for electric component and $k = 2$ for magnetic component

(1)	e.m.-1 or our physical plane:	$\{\mathbf{a}^1, \mathbf{a}^2, \mathbf{a}^3\}$
(2)	e.m.-2 or astral-e.m. plane:	$\{\mathbf{a}^1, \mathbf{a}^2, \mathbf{a}^4\}$
(3)	e.m.-3 or mental-e.m. plane:	$\{\mathbf{a}^1, \mathbf{a}^2, \mathbf{a}^5\}$
(4)	the etheric plane:	$\{\mathbf{a}^k, \mathbf{a}^3, \mathbf{a}^4\}$
(5)	the astral plane:	$\{\mathbf{a}^5, \mathbf{a}^3, \mathbf{a}^4\}$
(6)	the lower mental plane:	$\{\mathbf{a}^5, \mathbf{a}^k, \mathbf{a}^3\}$
(7)	the upper mental plane:	$\{\mathbf{a}^5, \mathbf{a}^k, \mathbf{a}^4\}$

(A) In the earth-sun system case, the pole-star is probably of little mass but of immense size with respect to earth being like a “grain of sand”, but with other-plane electric charge and other-plane magnetic charge. Because, earth with large mass but no ordinary charge could have a little other-plane charge (being a place not too advanced), giving the pole-star’s electrical interaction to us, but the main interaction from earth to sun due to their masses is mainly gravitational, although both these celestial bodies also have ordinary magnetic fields. The sun should then theoretically have a significant other-plane magnetic charge (since it’s a very advanced place) for its magnetic interaction with the pole-star (i.e. giving a trinary system of earth + sun + pole-star, but different interactions between each pair, according to the $\mathbf{a}^1, \mathbf{a}^2, \mathbf{a}^3$ forces or form-axes).

(B) But the elementary particle analogue of this trinary system, I think involves the proton’s structure as hinted in t.4 of 8/25/1988 and t.254 of 8/6/1998, where (in same order) for ${}_1H^1$ we get: electron + black-hole-in-proton-center + positron-coupled-to-otherplane-magnetic-charge.

11 page 36: Chapter XI: The people of the planets

These mental communication messages of Keith’s book, mainly from the other existence-planes beyond ours, are saying that for example our solar system is much more than just what we earth scientists have so far observed, and almost all planets have a civilization of human intellects in some state that’s very similar to our present existence-plane on the Earth. E.g., even the planet Mercury, that we think of as being too hot and too close to the Sun for a human-like civilization, indeed has such a wonderful civilization in one of the other of the 12 existence-planes where the distance to the Sun and Mercury’s rotation period are in the physics of that plane about the same as Earth’s are for us in our plane of existence.

Page 36B that describes human life presently as well as long-ago within Jupiter, probably is actually indicating mental existence in Jupiter’s core and/or larger moons, maybe as part of the normal Jerusem’s seven Mansion Worlds stages near the star Sirius that doesn’t seem to be explicitly revealed in the *Urantia Book* (i.e. outside of Jerusem’s usual stages). Indeed, we find in Robert Shapiro’s channeled books: *Shining the Light*, Vol.5, page 100, “The Red Spot on Jupiter is a Portal that passes stabilizing energy from Sirius!”, and in *The Explorer Race*, Vol.2, pages 231-6, an account of a special group of humans here for only about 30 years, 2000 - 2030 AD, before they head into Jupiter. Being mental with no body because you’re electrical currents in an active planetary body’s rocks and minerals is more like what happens in the seven Mansion Worlds of Jerusem (or “the 7 planes” of Keith’s book), rather than being a beginning human intellect of this third creation of the 7 types listed in the *Urantia Book*, but maybe the *Urantia Book* just wasn’t the place to inform us about this rôle of Jupiter being now part of

the afterlife as a complication of Jerusem's rôle.

The report (36D) that Mars is a planet where there is presently no intellectual life (i.e. in any existence-plane) agrees with the few other sources of information that I have about Mars: Firstly, in 1978 Elizabeth Clare Prophet brought to our class the message that all the human life presently on Mars was locked up in the astral existence-plane, and that eventually we scientists of Earth would help unlock them and set them free; and secondly, in Robert Shapiro's *Shining the Light*, Vol.4, page 426-7, and several other sources, we find that Mars is currently inhabited underground by a few non-intellectuals, although I don't yet fully understand this, e.g. whether they are wholly within our existence-plane (but in recent high-definition NASA photography on the surface of Mars, that has more UV sensitivity, you can spot wispy imagery of house-like structures that might be something like (abandoned) 'mixed-existence-plane' shacks; examine the JPEG file extremely carefully, with about $\times 4$ magnification, especially on the left side). I.e., they went underground long-ago when Mars lost its atmosphere during a cataclysmic event.

Vulcan (39B) is a nearly-invisible planet that some previous-day astronomers and astrologers have claimed to have somehow detected or spotted telescopically crossing the sun's face in an inter-Mercurial orbit that is quite close to the sun. So I do not think that Vulcan and the pole-star could be the same planet, but Vulcan probably has relatively little matter within its body that belongs to our existence-plane, and this is probably why we have great difficulty spotting it.

Certainly one of the current errors in supposing that "dark matter" e.g. exists, is due entirely to our not understanding that when light passes through a sufficiently intense gravity field, koilon-quantum transitions to other existence-plane photons do in fact occur!

12 page 40: Chapter XII: The mental world in more detail

13 page 44: Chapter XIII: Our mental world life will concern our coming to perfection

One of the most prominent but little understood concepts in Keith's book is that of "the mind cell" (appears a total of 18 times, over 8 chapters). "In the case of a particular molecule, there are three key frequencies tuning into its vortexal structure, and these offer the possibility of restructuring matter into different crystalline forms. However, the abstract mind or mind cell implants into the hypothalamus where its energies are stepped down to match those of the brain. This is not a function of ego or of the earth-bound structure. It cannot be manipulated by the individual and it cannot be changed. The mind cell is something you might be tuned into or might not. It is the way one lives one's life - the longer patterns of life, the basic philosophy, belief system, the conduct of life, the basic life structure - that taps into the universal mind cell. Sometimes things are done to either improve or degrade (as in spiritual war) the manner in which the mind cell attaches to the individual human. Any communication through the mind cell has certain times more favorable than others. This is the matter of tuning to the mind cell. Some individuals live almost their entire lives in tune with their mind cell, and these are the ones who are coming to perfection. The mind cell is archetypal in time and space to your form, what is known as your soul. The soul is difficult to reach as it is the mind cell which has qualities permanent through time, so that your soul is the same now as it was 100,000 years ago. So if one is an engineer, or a business person, a priest, a politician, or a leader, these are all different aspects of the soul that you cannot influence to any great extent. You can merely influence the extent to which it imprints upon you, and you can influence this in the growth of crystalline structures. That is, the higher the frequency or scope of one's ability to see into the past and into the future determines the breadth of these vortexal reactions, the extent of the frequency development, and the extent that the grid is able

to respond vibrationally, and thus the extent of the programming that can be brought into the presence of matter.” (interpreted from t.15 of 10/17/1989)

“The particular configuration of the brain, the neurons and their attachment to the cholesterol molecules and liquid crystal systems in the brain, enable a transduction of energies from this high frequency mind cell into the lower frequency system of the nervous system wherein thoughts and images can impinge upon the mind’s eye, and visions can occur in the brain.” (adapted from t.60 of 2/18/1992)

A bio-cell of any kind, but especially the mind cell, is interesting especially because of its relationship to the non-commutative geometry that describes the quantum physics of the mind-grid as it relates to spacetime. That is, the axioms of the geometry that are most useful for the needed mathematical physics of the toroid↔spinor cycle between inverse and direct space, will be found to mimic the operation of these biological cells (and vice versa), and particularly the operation of the mind cell! “As biophotons emit from your cells, they are dual as quantum events that extend out of spacetime. This is how your etheric body and astral body communicate with your cellular structure on a regular basis. The etheric information of the e.m.-2 field moves through the toroid structure of the DNA, which controls all the molecular reactions and causes energy to move outward from the nucleus to the membrane of the cell which is highly charged, and amplifies this as it creates the biophoton. These communicate back into the etheric and back to the surrounding cellular matter, so that cells communicate with themselves and with 4D using the biophoton. But the biophoton has another half loop, beyond this lower loop of the e.m.-2, because the biophoton has an exact correspondence with a structure of information in the 4D toroid. So this creates the biophoton in the cell from the DNA as the toroid, out through the cytoplasm to the membrane, which is waves that move across the cell as lower wave components of both the photon and phonon, as the cell literally ripples and convulses and produces these many wave forms which are representative of its information content, and these guide the cell to perform its actions.” (adapted from t.137 of 2/3/1996)

14 page 48: Chapter XIV: The 1st super-plane

The eight chapters that mention “vibratory activity” are of course referring to the above bio-photonic energies of both photon and phonon that are produced by the bio-cell’s charged membrane, although the vibratory energies from the mind cell are much higher in frequency, and these of course appear in the great mental world. Even from just most arcana, one believed that the humanitys of the first two creations essentially all “ascended,” and indeed Keith describes how in those days everyone entered the afterlife near the level of the fifth plane (24B). But now in this third creation the situation is very different (44C). Apparently when man is within the planet, there is not much separation of his personality from that of others, but with his mind cell attached to vegetation, his now private meditation is still not much deteriorated by what he can barely sense through the plant’s biosystem around his stationary position on the planet’s surface.

15 page 51: Chapter XV: The 2nd super-plane

16 page 55: Chapter XVI: Man should be a creator too: the 3rd super-plane

Keith’s book shows us one very outstanding thing that we at our present level of awareness certainly almost never realized before, namely that most of the design work and planning (besides the maintenance) of our present-day biology and terrestrial ecosystem were done by man himself, that is by men a lot like us who lived very, very long ago.

17 page 58: Chapter XVII: Human intellect development: the 4th super-plane

18 page 61: Chapter XVIII: The last super-plane (the 5th): responsible for the animal creation, including man

The Creator is exercising His desire and His will in these creations too, particularly by working through those intellects of the completed humanitys in the super-planes below Him, and the creation of men in this third creation, and the maintenance of this animal creation, are due to the Creator now working through the humanitys of the first two creations! I.e., our existence and daily lives are always a stepped-down process of the Creator's enormous energies.

19 page 65: Chapter XIX: Remainder of book is articles and extracts of great men

20 page 67: Chapter XX: How man began, inside the planet

If the inside of a planet that is hosting human life were known to be a specially-constructed super-computer, then of course it would be easier to accept these and similar claims. But at most within the planets are only rocks and minerals. Still, the book, *Explorer Race and Particle Personalities*, Vol. 5, channeled by Robert Shapiro, 1997, for example, explains how even the smallest of the elementary particles has intellect, consciousness, and complete memories of its past activities. So, we might conjecture that the Creator enables these smallest of the particles to form somehow a network of mind cells that are attached vibrationally to certain magnetic rocks, without significantly altering the chemical and mineral makeup of the planet, where natural galvanic activity could then supply such a network with electrical power. Mental man in this type of existence, thus limited in his freedom due to being circumscribed and under a lot of specially-designed surrounding influences (e.g. it might be even more difficult for him to leave his planet), would be straight-forward for us to understand.

21 page 70: Chapter XXI: A message from the Creator to man

22 page 71: Chapter XXII: Benjamin Franklin, George Washington, and Abraham Lincoln speak in our time

These last two chapters are especially what make Keith's book a 'one of a kind' source of information given to earth's physical man.
